

AI Service Project Setup Guide

This guide explains how to set up and run the AI service project using Python 3.10 and `requirements.txt`.

1 . Clone or Download the Project

Ensure you have the project folder (`ai-service`) on your machine. For example:

```
C:\Users\YourName\Projects\ai-service
```

2 . Create a Python Virtual Environment

Open a terminal in the project folder and create a virtual environment:

```
python3.10 -m venv venv
```

3 . Activate the Virtual Environment

- **Windows (PowerShell):**

```
.\venv\Scripts\Activate.ps1
```

- **macOS / Linux:**

```
source venv/bin/activate
```

Once activated, your terminal should show `(venv)` before the path.

4 . Install Project Dependencies

With the virtual environment activated, install all dependencies:

```
pip install -r requirements.txt
```

This will install packages like Flask, DeepFace, OpenCV, NumPy, Requests, etc.

5 . Run the AI Service

Run the Flask app using Python:

```
python app.py
```

By default, the app will start on port `3001`.

6 . Test the API

You can send a POST request to `/analyze` endpoint with a JSON body containing `imageUrl`.
Example using `curl`:

```
curl -X POST http://127.0.0.1:3001/analyze
-H "Content-Type: application/json"
-d '{"imageUrl": "https://example.com/image.jpg}"'
```

The API will return a JSON response with `gender`, `age`, and `skinTone`.

Notes

- Always activate the virtual environment before running the project.
 - Do not share the `venv` folder; others can recreate it using the `requirements.txt`.
 - Make sure Python `3.10` is installed on your machine.
